/note=Tvetcs: pME18S-FL3; Site_1: DraIII (CACTGTGTG);
Site_2: DraIII (CACCATGTG); lst Strand cDNA was primed
with an oligo(dT) primer [ATGTGGCCTTTTTTTTTTTTTTTTT];
double-stranded cDNA was ligated to a DraIII adaptor
[TGTTGGCCTACTGG], digested and cloned into distinct DraIII
sites of the pME18S-FL3 vector (5' site CACTGTGTG, 3' site
CACCATGTG). XhoI should be used to isolate the cDNA
insert. Size selection was performed to exclude fragments
cl.5kb. Library constructed by Dr. Sumio Sugano
(University of Tokyo Institute of Medical Science).

/sex="Male" coll strain X110-Gold, T1-resistant, F-"
/lab host="E. Coli strain X110-Gold, T1-resistant, F-"
/clone lib="Mouse 10kb plasmid UUGCIM library"
/note="Vector: PWD42nv; Purified genomic DNA from M.
musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resource
/(http://www.jax.org/resources/documents/dnares/). The DNA
was bydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWD42 (gil 4732114] gbl AFL29072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."

The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymuclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gol electrophoresis. Vector DNA was prepared from a derivative of pwD42 (dil 4732114 [gol Phz29072.1], a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the innert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Contact: Robert B.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 4, P

```

Pred. No. is the number of results predicted by chance to have a

em\_htgo\_other:\*

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                       ò
                                                                                                                                                                                                                                                                                                                           The invention relates to treatment of conditions associated with high administering an oligonucleotide N3' => Ps' phosphoramidate having a sequence complementary to part of the telomere-binding region (TBR) of the RNA component of telomerase, so as to inhibit its activity. The N3' => Ps' oligonucleotide phosphoramidates are used therapeutically to inhibit cell proliferation, e.g. against a wide range of solid tumours or leukaemia, and also against fungal and protozoal pathogens. They are soluble and resistant to nuclease, and they bind strongly to RNA forming short but stable duplaxes under physiological conditions. Thus they are sequence represents a specific example of an oligonucleotide N3' => Ps' phosphoramidate disclosed in the specification.
                                                                                            Treating elevated telomerase levels with N3 to P5 oligonucleotide phosphoramidates - that bind to the RNA component of telomerase, specifically for preventing growth of cancer cells, fungi and
                                                                                                                                                                                                                                                                    Claim 5; Page 25; 38pp; English.

DNA oligonucleotide 6, used in the measurement of Tm values.

Peptide nucleic acid; PNA; cancer; telomerase; probe; hybridisation; inhibitor; human telomerase RNA; hTR; PCR; oligonucleotide; ss.

Wright WE Shay JW, Piatyszek MA,

New peptide nucleic acids hybridising to mammalian telomerase used to inhibit telomerase, for treating tumours and other proliferative diseases, also for diagnosis

This sequence is a novel peptide nucleic acid (PNA), which acts as an inhibitor of mammalian, preferably human, telomerase. The PNAs hybridise specifically to an RNA component of mammalian telomerase, and include the sequence GGG for specific hybridisation to the template region of this component. PNAs can be used as probes to detect the RNA component of mammalian telomerase and as inhibitors of telomerase activity, especially in the treatment of cancer.

The hybridised product and oligonucleotides are then contacted with ligase and the ligated form of the oligonucleotides detected.

The method can be used to detect cancer, e.g. carcinomas of the breast, colon, oesophagus, kidney, liver, lung, ovaries, prostate, stomach, uterus, pancreas and head and neck, sarcomas of bone and muscle, leukaemias, myelomas, lymphomas, neuroblastomas, astrocytomas, gliomas, glioblastomas, neuroblastomas and melanomas. The method can also be used to screen for

cancers, neoplasia, hyperplasia, neurodegenerative diseases, aging, human imay be used the uncodegenerative diseases, aging, human immunodeficiency virus (HIV) infection/AIDS (acquired immunodeficiency syndroms) and associated pathologies, fungal infections, and other consistency diseases characterized by abnormal telomere metabolism or telomerase activity, in combination with antineoplastic and other cytotoxic or cytostatic agents, antifungal agents, and other nucleotides. PNNs may be used for molecular diagnostics, labelled PNNs are used as hybridization probes to detect or quantitate polyucolectides having a human telomerase of individuals, e.g. paternity testing, based on hTR gene restriction fragment length polymorphism (RRLP) pattern. PNNs are also useful as probes to detect the RNA component of a mammalian telomerase and as probes to detect the RNA component of a mammalian telomerase and as inhibitors of telomerase activity. The method of the present invention allows cancerous conditions to be detected with increased confidence and possibly at an earlier stage, before cells are detected as cancerous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents a peptide nucleic acid molecule which phybridises to the mRNA component of mammalian telomerase, and inhibits telomerase activity. Telomerase is a ribonucleoprotein enzyme that synthesizes one strand of the telomeric DNA, using as a template an inucleotide sequence contained within the RNA component of the enzyme. The invention relates to PNA molecules having a sequence of no more than 25 bases, which include the sequence GTTAGG. The uncharged nature of the PNA increases the melting temperature of associating strands, increases the resistence of degradation by proteases or nucleases. The therapeutic PNAs may be used for treating disease conditions such as
                                                                                                                                                                                                                                                                                                                                                                       "Peptide nucleic acid molecule, where N-(2-aminoethyl)glycine units are linked to nucleotide bases via glycine amino N through a methylenecarbonyl linker"

based on pathological characteristics. The diagnostic and prognostic methods of the present invention can be used to detect an immortal or neoplastic cell or tumour tissue or cancer of any origin, provided the cell expresses telomerase activity and its RNA component.

888888

```
The present sequence represents a peptide nucleic acid molecule which hybridises to the mRNA component of mammalian telomerase, and inhibits telomerase activity. Telomerase is a ribonucleoprotein enzyme that synthesizes one strand of the telomeric DNA, using as a template an 11 nucleotide sequence contained within the RNA component of the enzyme. The hivertion relates to PNA molecules having a sequence of no more than 25 bases, which include the sequence GTMAGG. The uncharged nature of the PNA backbone increases the melting temperature of associating strands,

increases the rate of degradation by proteases or nucleases. The characterized resistance of degradation by proteases or nucleases. The characterized neoplasia, hyperplasia, neurodegenerative diseases, aging, human immunodeficiency virus (HIV) infection/AIDS (acquired immunodeficiency syndrome) and associated pathologies, fungal infections, and other syndrome) and associated by abnormal telomere metabolism or telomerase activity, in combination with antinoplastic and other cytotoxic or cytostatic agents, antifungal agents, and other nucleotides. PhAs may be used for molecular disapostics, labelled PNAs are used as hybridization probes to detect or quantitate polynucleotides having a human telomerase NA, (HTR) sequence. PNA probes are also used for forensic identification fragment length polymorphism (FFLP) pattern. PNAs are also useful as probes to detect the RNA component of a mammalian telomerase and as inhibitors of telomerase activity. The method of the present invention allows cancerous conditions to be detected with increased confidence and possibly at an earlier stage, before cells are detected as cancerous conditions to be detected with increased confidence and possibly at an earlier stage, before cells are detected as cancerous conditions to be detected with increased confidence and possibly at an earlier stage, before cells are detected as cancerous conditions to be used to detect an immortal or neoplastic cell or tumour tissue or cancer of any origin, provided the cell expresses telomerase activity and its RNA component.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Peptide nucleic acid; PNA; telomerase; ribonucleoprotein enzyme; cancer; inhibitor; neoplasia; neurodegenerative disease; aging; hyperplasia; AIDS; HIV; fungal infection; forensic identification; detect; tumour; paternity testing; ss

New peptide nucleic acid (PNA) compounds that inhibit telomerase activity in mammalian cells is useful as probes to detect the RNA component of a mammalian telomerase

Claim 9; Column 71-72; 45pp; English.

The present sequence represents a peptide nucleic acid molecule which hybridises to the mRNA component of mammalian telomerase, and inhibits telomerase activity. Telomerase is a ribonucleoprotein enzyme that synthesizes one strand of the telomeric DNA, using as a template an 11 nucleotide sequence contained within the RNA component of the enzyme. The invention relates to PNA molecules having a sequence of no more than 25 accepts. The mucleotide sequence contained within the RNA component of the enzyme. The invention relates to PNA made and association with targeted nucleic acids, and a fafords greater resistance of association with targeted nucleic acids, and a fafords greater resistance of degradation by proteases or nucleases. The increases the melting temperature of association with targeted nucleic acids, and a fafords greater resistance of degradation by proteases or nucleases. The increases the rate of association with targeted nucleic acids, and a fafords greater resistance of degradation by proteases or nucleases. The cancers, neoplasia, hyperplasia, neurodegenerative dimmunodeficiency virus (HIV) infection/ALDS (acquired immunodeficiency syndrome) and associated pathologies, fungal infections, and other cyclocoxic or diseases characterized by abnormal telomer metabolism or telomerase activity, in combination with antinooplastic and other cyclocoxic or cycostatic agents, antifungal agents, and other nucleotides. PNAs may be used for molecular diagnostics, labelled PNAs are used as hybridization probes to detect tor quantitate polynucleotides having a human telomerase of telomerase activity. The method of the present invention of probes to detect the RNA component of a mammalian telomerase and as inhibitors of telomerase activity. The method of the present invention and propositic and prognostic methods of the present invention can be used to detected as cancerous conditions to be detected with increased confidence of methods of the present invention can be used to detect an immore of cell expresses telo

New peptide nucleic acid (PNA) compounds that inhibit telomerase activity in mammalian cells is useful as probes to detect the RNA component of a mammalian telomerase -

Example 1; Column 27-28; 45pp; English.

The present sequence represents an antisense oligonucleotide used as a control sequence alongside a peptide nucleic acid molecule which hybridises to the mRNA component of mammalian telomerase, and inhibits telomerase activity. Telomerase is a ribonucleoprotein enzyme that telomerase activity. Telomerase is a ribonucleoprotein enzyme that strands of the telomeric DNA, using as a template an 11 nucleotide sequence contained within the RNA component of the enzyme. The invention relates to PNA molecules having a sequence of no more than 25 bases, which include the sequence GTTAGG. The unchanged nature of the PNA backbone increases the melting temperature of associating strands, increases the rate of association with targeted nucleic acids, and afformed presert resistance of degradation by proteases or nucleases. The therapeutic PNAs may be used for treating disease conditions such as afformed inmunodeficiency virus (HIV) infection/AIDS (acquired immunodeficiency syndrome) and associated pathologies, fungal infections, and other immunodeficiency virus (HIV) infection/AIDS (acquired immunodeficiency syndrome) and associated pathologies, fungal infections, and other cytocoxic or cyctostatic agents, antifungal agents, and other nucleotides. PNAs may be detect or molecular diagnostics, labelled PNAs are used as hybridization or probes to detect or quantitete polymuleotides having a human telomerase activity, in combination with increased on hTR gene restriction of fragment length polymorphism (RPLD) pattern. PNAs are also used as probes to detect the RNA component of a mammalian telomerase and as probes to detect the RNA component of a mammalian telomerase and as probes to detect the RNA component of a mammalian telomerase and as inhubitors of telomerase activity. The method of the present invention can be used to detect an immortal or necessary continued to based on pathological characteristics. The diagnostic an immortal or neoplastic cell expresses telomerase activity and its RNA component.

```
The present sequence was synthesised in an example illustrating an invention relating to polynucleotides comprising a non-homopolymeric sequence of nucleoside subunits joined by at least one inter-subunit linkage that is a N<sup>2</sup>-F<sup>2</sup> thiophosphoramidate. The thiophosphoramidate oligonucleotides retain a high RNA binding affinity and exhibit a much higher acid stability. They are useful for detecting a specific sequence in a sample, by forming a hybridisation complex with the sequence. They are useful for inhibiting function of an RNA in a call (for inhibiting translation of a medicament for translation of a maxNA or for inhibiting telomerase enzyme in a call). They are also useful in the preparation of a medicament for treatment of viral infection or cancer. The oligonucleotides are useful for anti-sense and anti-gene diagnostic or therapeutic applications and may be used for treating telomerase-mediated conditions or diseases, such as
                                                                                                                                                                                                                                                                        Thiophosphoramidate oligonucleotide, virucide, cytostatic, immunosuppressive, contraceptive, RNA inhibitor, telomerase inhibitor, antisense therapy, viral infection, cancer, hyperproliferative disorder, autoimmune disorder, ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel thiophosphoramidate polynucleotide useful for detection of RNA or DNA having a given target sequence, for inhibiting RNA function in a cell, and for treating cancer and viral infection

```

The present sequence is that of a N3'-P5' 2'-arabino-fluoro phosphoramidate oligomuclectide that is complementary to telomerase RNA. The oligomuclectide was used to assess the relative efficacy of novel 2'-arabino-fluoro phosphoramidate oligomuclectides and their 2'-ribo fluorooligomuclectide counterparts (see AAH2728-35) for the inhibition of telomerase cutivity. Novel phosphoramidate 2'-arabino-fluorooligomuclectides are generally more acid stable, more resistant to cellular proteases, and also show greater telomerase inhibition activity than 2'-ribose-fluoro phosphoramidates. They are therefore useful contracting cancer (claimed) and other diseases in which telomerase activity is present at abnormal levels, such as hyperpoliferative or autoimmune diseases e.g. psoriasis, rheumatoid arthritis. Sequence 11 BP; 2 A; 0 C; 5 G; 4 T; 0 other; treatment of viral infection (claimed). Example 6; Page 46; 61pp; English.

proliferation by treating cells with at least one oligonucleotide, or its fragment. The compounds, which have cytostatic, anti-allergic, anti-inflammatory, dermatological, auti-postratic and immunosuppressive activities, function as 'ultra-violet mimics' to induce DNA repair processes (or a protective response to later exposure to DNA repair processes (or a protective response to later exposure to Tradiation or chemicals), as a proliferation inhibitor, apoptosis inducer or a tumour necrosis factor inhibitor. Probably they mimic products of DNA damage, or processed DNA-damage intermediates, by inducing the p53 pathway, resulting in transient arrest of cell growth, allowing more time for DNA repair to occur before cell division takes place. The method is especially used to treat carcinoma but may also be used to: treat other C hyperproliferative states (e.g. psoriasis or precancerous conditions); reduce photoaging, oxidative stress or damage; prevent skin cancer; treat allergically mediated inflammation (atopic or contact dermatitis).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              anti-inflammatory; dermatological; ophthalmological; anti-psoriatic; immunosuppressive; DNA repair; proliferation inhibitor; apoptosis; immunosuppressive; DNA repair; proliferation inhibitor; apoptosis; carcinome, oxidative stress; skin cancer; allergy mediated inflammation; conjunctivitis; allergic rhinitis; vitiligo; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Inhibiting proliferation of epithelial cells, useful e.g. for treating carcinoma, using specific oligonucleotides that mimic the effects of ultra-violet light
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Melanin, melanogenic; oligomer; cytostatic; anti-allergic; p53;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention describes inhibition of mammalian epithelial cell

                                                                                                                                                                                                                                                             g
                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention describes inhibition of mammalian epithelial cell
proliferation by treating cells with at least one oligonucleotide, or
the first fragment. The compounds, which have cytostatic, anti-allergic,
anti-inflammatory, dermatological, ophthalmological, anti-allergic,
anti-inflammatory, dermatological, ophthalmological, anti-allergic,
immunosuppressive activities, function as 'ultra-violet mimics' to induce
the parair processes (or a protective response to later exposure to
radiation or chemicals), as a proliferation inhibitor, apoptosis inducer
or a tumour necrosis factor inhibitor. Probably they mimic products of
the parair to occur before cell division takes place. The method is
pathway, resulting in transient arrest of cell growth, allowing more time
for DNA repair to occur before cell division takes place. The method is
compared to treat carcinoma but may also be used to:
thyperproliferative states (e.g. psoriasis or precancerous conditions);
reduce photoaging, oxidative stress or damage; prevent skin cancer; treat
allergically mediated inflammation (atopic or contact dermatitis,
cells caused by radiation or chemicals; increase melanin production
colls on promote apoptosis in epithelial cells (e.g. for treating vitiligo), and to
promote apoptosis in response to DNA damage, in epithelial cells that
contain damaged by radiation or chamicals;
sequence is melanogenessis and conjugnocleotide #5, representative
confinitis menanogenessis and coligonucleotide #5, representative
confinitis melanogenessis and one of the oligonucleotides used
conjuder to inhibit mammanian epithelial cell proliferation, described in the
                                                                                                                                                                                                                                                             Melanin, melanogenic; oligomer; cytostatic; anti-allergic; p53; anti-inflammatory; dermatological; ophthalmological; anti-psoriatic; immunosuppressive; DNA repair; proliferation inhibitor; apoptosis; tumour necrosis factor inhibitor; photoaging; hyperproliferative disease; carcinoma; oxidative stress; skin cancer; allergy mediated inflammation; conjunctivitis; allergic rhinitis; vitiligo; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Inhibiting proliferation of epithelial cells, useful e.g. for treating carcinoma, using specific oligonucleotides that mimic the effects of ultra-violet light -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /note= "OTHER= Optionally phosphorothiolate linkages"

New peptide nucleic acids that hybridizes to the RNA component of mammalian telomerase, useful for treating or preventing cancer, inflammation, lymphoproliferative diseases, autoimmune disease, or neurodegenerative diseases

Claim 7; Column 73; 46pp; English.

The present invention relates to peptide nucleic acids (PNAs), comprising a sequence of 6-25 nucleobases, that inhibit telomerase activity in mammalian cells by hybridising to the RNA component of mammalian

telomerase. The PNAs are useful as probes to detect the RNA component of mammalian telomerase and as inhibitors of telomerase activity, or to detect and/or quantitate polynucleotide having the human telomerase RNA component (hTR) sequence, as well as in forenaic identification of individuals, such as paternity testing or identification of criminal suspects or unknown descendants based on the hTR gene RFLP pattern. The PNA can be further used for treating or preventing cancer, inflammation, lymphoproliferative diseases, autoimmune disease, or neurodegenerative diseases. The PNAs in combination with other pharmaceuticals (such as antineoplastic or cytostatic agents) can be used for treating neoplasia, hyperplasia, human immunodeficiency virus (HIV) infections, acquired immunodeficiency sylving associated pathologies, and other diseases characterised by abnormal telomere metabolism or telomerase activity. The present sequence represents one of the PNA sequences of the invention. 88888888888888888888888

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ORIGIN
                                                                                                                                (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch oritice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwaye2 (gql 4772114[gb]AR12972.1), a copy number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent B. coli Xiii0-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             TA158A03P 20 bp DNA linear GSS 13-DEC-2000 T. brucei sheared genomic DNA clone 158a03, forward sequence,

Details of T. brucei sequencing at the Sanger Centre are available at http://www.sanger.ac.uk/Projects/T_brucei/.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Constructed at the Institute for Genomic Research (TIGR),
Rockville, MD. Genomic DNA isolated from a cloned population of
Trypanosoma brucei (TREU927/4 GUTAL 10.1) was mechanically sheared
to give a tight size discribution (
4 kb). The v + i method used for the library construction is
described in detail in Smith, H. and Venter, J.C. (Making small
innsert libraries for whole genome shotgun sequencing projects. In
Genome Sequencing: A Practical Approach, eds. M. Vaudin and B.
Barrell, Oxford University Press, 1999).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Email: nelsayed@tigr.org

```
(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114[gb]AF129072.1), a copy number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XLLO-Gold (Stratagene) cells and selected for ampicillin resistance."

The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil 4712114 [gb] AR129072.1); a copy.number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli Xiil-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gal electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114|gb|AF129072.1). a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XLLO-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  COMMENT
```

```
(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwalp42 (gil-4732114[gb]AP129072.1), a copy number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent B. coli Xi10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               23 bp DNA linear GSS 13-DEC-2000

Rockville, MD. Genomic DNA isolated from a cloned population of
Trypanosoma brucei (TREU927/4 GUTAT 10.1) was mechanically sheared
to give a tight size distribution (
4 kb). The v + i method used for the library construction is
described in detail in Smith, H. and Venter, J.C. (Making small
insert libraries for whole genome shotgun sequencing projects.
Barrell, Oxford University Press, 1999).

```
Constructed at the Institute for Genomic Research (TIGR),
Rockville, MD. Genomic DNA isolated from a cloned population of
Trypanosoma brucei (TREND27/4 GUTat 10.1) was mechanically sheared
to give a tight size distribution (
4 kb). The v+i method used for the library construction is
described in detail in Smith, H. and Venter, J.C. (Making small
insert libraries for whole genome shotgun sequencing projects. In
Genome Sequencing: A Practical Approach, eds. M. Vaudin and B.
Barrell, Oxford University Press, 1999).

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 2,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 1,

where (deoxy(ribose-phosphate linkages are replaced by
N-(2-aminoethyl)glycine units linked to nucleotide bases via
glycine amino N through a methylenecarbonyl linker"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 44, Application US/08838545

Sequence 44, Application US/08838545

Patent No. 6046307

GENERAL INFORMATION:
APPLICANT: Wright, Woodring E.
APPLICANT: Wright, Woodring E.
APPLICANT: Corey, David E.
APPLICANT: No. 6046307con, James C.
TITLE OF INVENTION: Modulation of Mammalian Telomerase by TITLE OF INVENTION: Peptide Nucleic Acids
NUMBER OF SEQUENCES: 60
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                100.0%; Score 11; DB 3; Length 11; 100.0%; Pred. No. 1.6e+02; Live 0; Mismatches 0; Indele
                                                                                                                                                                                                                                           CURRENT APPLICATION DATA:
